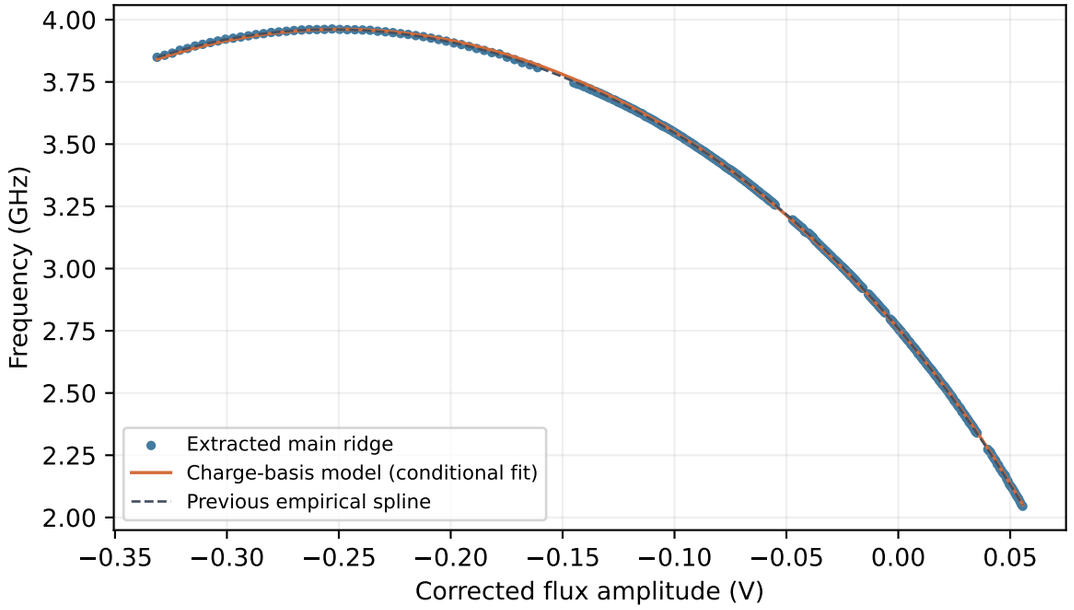
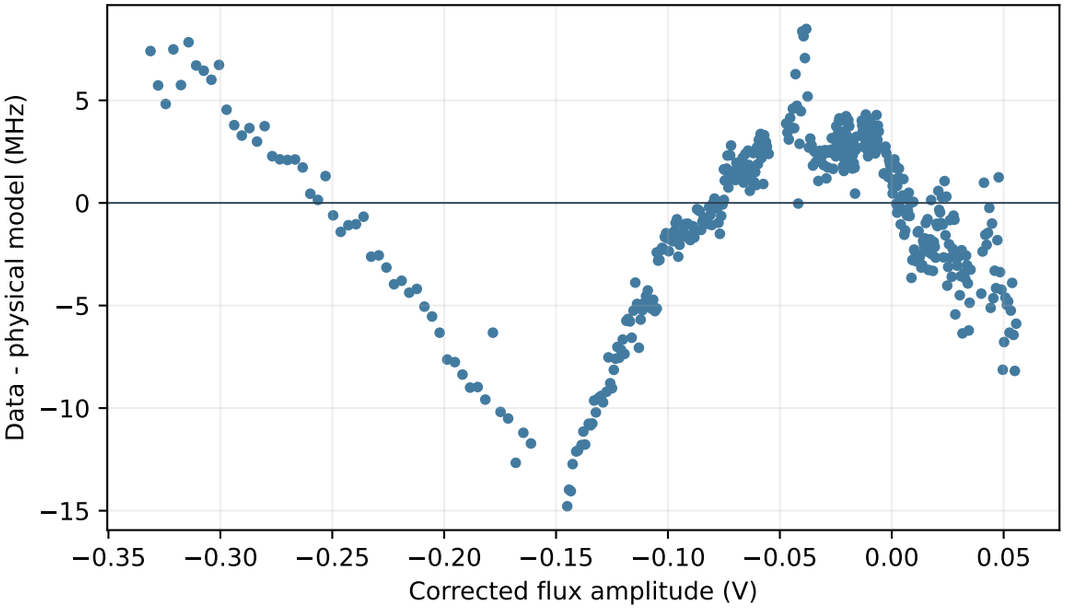
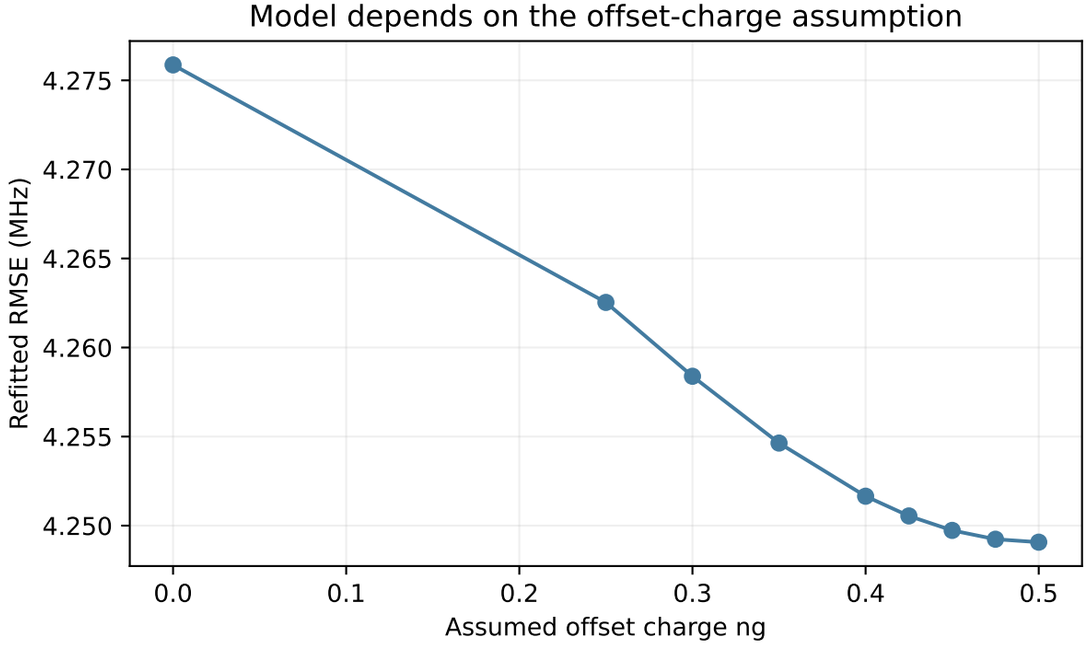
Tunable-transmon model exploration | #1608-#1618 | flux correction fixed

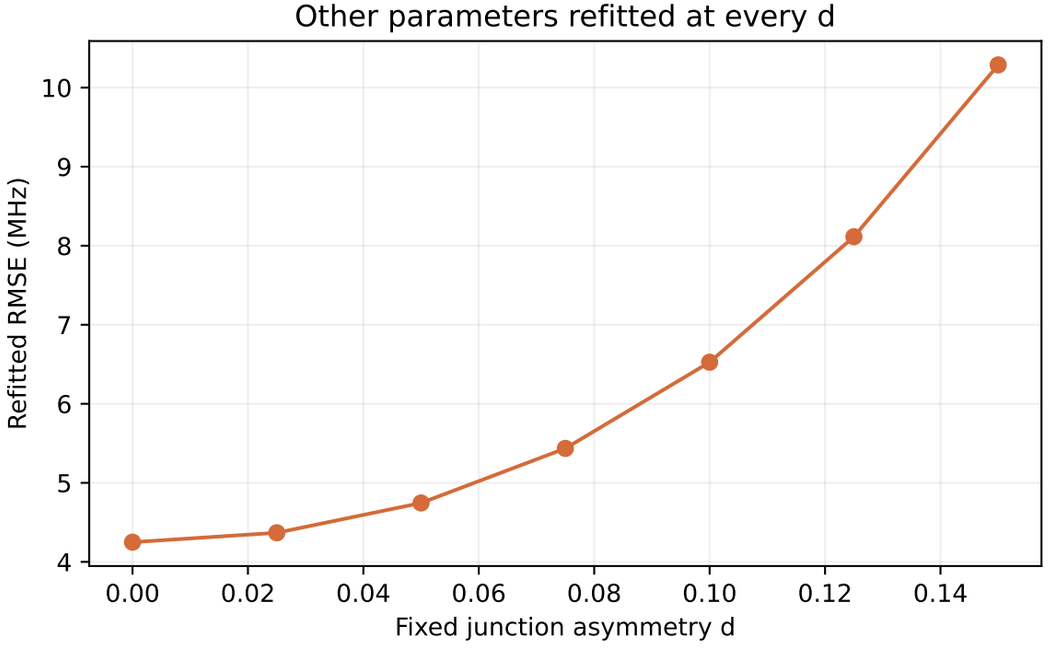
$$H/h = 4e_C(\hat{n} - n_g)^2 - e_{J,\mathrm{eff}}(V)\cos\hat{\varphi}, \quad f_{01} = \lambda_1 - \lambda_0$$

$$e_{J,\mathrm{eff}} = e_{J\Sigma}\sqrt{\cos^2\theta + d^2\sin^2\theta}, \quad \theta = \pi(V_{\mathrm{corr}} - V_s)/V_{\Phi_0}$$









Conditional isolated-transmon estimates. The weak d/ng distinction and flux-registration uncertainty limit parameter interpretation.
